

# MOS INTEGRATED CIRCUIT

# $\mu$ PD42S4400, 424400

### 4 M-BIT DYNAMIC RAM

### 1 M-WORD BY 4-BIT, FAST PAGE MODE

#### Description

The  $\mu$ PD42S4400, 424400 are 1,048,576 words by 4 bits CMOS dynamic RAMs. The fast page mode capability realize high speed access and low power consumption.

Besides, the  $\mu$ PD42S4400 can execute  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  self refresh.

These are packaged in 26-pin plastic TSOP(II) and 26-pin plastic SOJ.

#### Features

- 1,048,576 words by 4 bits organization
- Single +5.0 V  $\pm$  10 % power supply
- Fast page mode
- Fast access and cycle time

| Part number                   | Power consumption<br>Active (MAX.) | Access time<br>(MAX.) | R/W cycle time<br>(MIN.) | Fast page mode<br>cycle time<br>(MIN.) |
|-------------------------------|------------------------------------|-----------------------|--------------------------|--|

Pin Configurations (Marking Side)

26-pin Plastic TSOP (II) (300 mil)

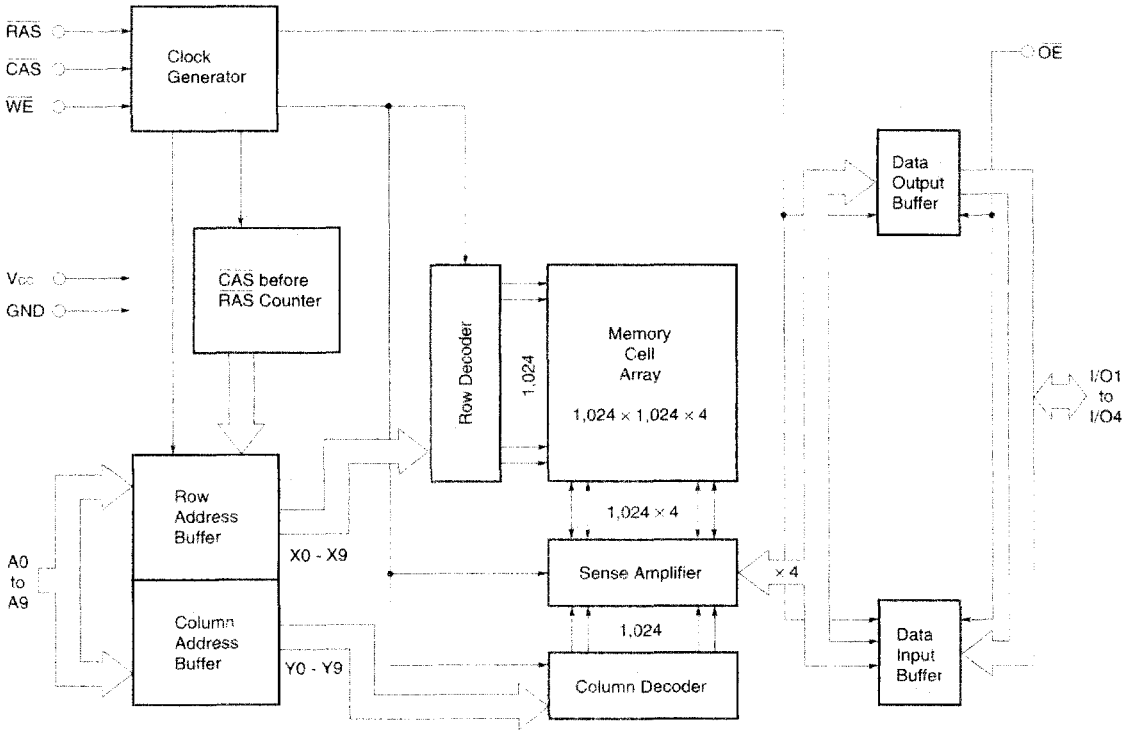

26-pin Plastic SOJ (300 mil)

- A0 to A9 : Address Inputs
- I/O1 to I/O4 : Data Inputs/Outputs
- $\overline{\text{RAS}}$  : Row Address Strobe
- $\overline{\text{CAS}}$  : Column Address Strobe
- $\overline{\text{WE}}$  : Write Enable
- $\overline{\text{OE}}$  : Output Enable
- V<sub>cc</sub> : Power Supply
- GND : Ground

Block Diagram

**Input/Output Pin Functions**

The μPD42S4400, 424400 have input pins  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ ,  $\overline{OE}$ , A0 to A9 and input/output pins I/O1 to I/O4.

| Pin name                                    | Input/Output | Function  |
|---|--------------|---|
| $\overline{RAS}$<br>(Row address strobe)    | Input        | $\overline{RAS}$ activates the sense amplifier by latching a row address and selecting a corresponding word line.<br>It refreshes memory cell array of one line selected by the row address.<br>It also selects the following function.<br>• $\overline{CAS}$ before $\overline{RAS}$ refresh   |
| $\overline{CAS}$<br>(Column address strobe) | Input        | $\overline{CAS}$ activates data input/output circuit by latching column address and selecting a digit line connected with the sense amplifier.  |
| A0 to A9<br>(Address inputs)                | Input        | Address bus.<br>Input total 20-bit of address signal, upper 10-bit and lower 10-bit in sequence (address multiplex method).<br>Therefore, one word is selected from 1,048,576-word by 4-bit memory cell array.<br>In actual operation, latch row address by specifying row address and activating $\overline{RAS}$ .<br>Then, switch the address bus to column address and activate $\overline{CAS}$ .<br>Each address is taken into the device when $\overline{RAS}$ and $\overline{CAS}$ are activated<br>Therefore, the address input setup time ( $t_{ASR}$ , $t_{ASC}$ ) and hold time ( $t_{RAH}$ , $t_{CAH}$ ) are specified for the activation of $\overline{RAS}$ and $\overline{CAS}$ . |
| $\overline{WE}$<br>(Write enable)           | Input        | Write control signal.<br>Write operation is executed by activating $\overline{RAS}$ , $\overline{CAS}$ and $\overline{WE}$ .  |
| $\overline{OE}$<br>(Output enable)          | Input        | Read control signal.<br>Read operation can be executed by activating $\overline{RAS}$ , $\overline{CAS}$ and $\overline{OE}$ .<br>If $\overline{WE}$ is activated during read operation, $\overline{OE}$ is to be ineffective in the device.<br>Therefore, read operation cannot be executed.   |
| I/O1 to I/O4<br>(Data inputs/outputs)       | Input/Output | 4-bit data bus.<br>I/O1 to I/O4 are used to input/output data.  |

**Electrical Specifications**

- All voltages are referenced to GND.
- After power up ( $V_{CC} \geq V_{CC(MIN)}$ ), wait more than 100  $\mu s$  ( $\overline{RAS}$ ,  $\overline{CAS}$  inactive) and then, execute eight  $\overline{CAS}$  before  $\overline{RAS}$  or  $\overline{RAS}$  only refresh cycles as dummy cycles to initialize internal circuit.

**Absolute Maximum Ratings**

| Parameter                          | Symbol    | Condition | Rating       | Unit |
|------------------------------------|-----------|-----------|--------------|------|
| Voltage on any pin relative to GND | $V_I$     |           | -1.0 to +7.0 | V    |
| Supply voltage                     | $V_{CC}$  |           | -1.0 to +7.0 | V    |
| Output current                     | $I_O$     |           | 50           | mA   |
| Power dissipation                  | $P_D$     |           | 1            | W    |
| Operating ambient temperature      | $T_A$     |           | 0 to +70     | °C   |
| Storage temperature                | $T_{STG}$ |           | -55 to +125  | °C   |

**Caution** Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

**Recommended Operating Conditions**

| Parameter                     | Symbol   | Condition | MIN. | TYP. | MAX.           | Unit |
|-------------------------------|----------|-----------|------|------|----------------|------|
| Supply voltage                | $V_{CC}$ |           | 4.5  | 5.0  | 5.5            | V    |
| High level input voltage      | $V_{IH}$ |           | 2.4  |      | $V_{CC} + 1.0$ | V    |
| Low level input voltage       | $V_{IL}$ |           | -1.0 |      | +0.8           | V    |
| Operating ambient temperature | $T_A$    |           | 0    |      | 70             | °C   |

**Capacitance ( $T_A = 25\text{ }^\circ\text{C}$ ,  $f = 1\text{ MHz}$ )**

| Parameter                     | Symbol   | Test condition  | MIN. | TYP. | MAX. | Unit |
|-------------------------------|----------|---|------|------|------|------|
| Input capacitance             | $C_{I1}$ | Address   |      |      | 5    | pF   |
|                               | $C_{I2}$ | $\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$ , $\overline{OE}$ |      |      | 7    |      |
| Data input/output capacitance | $C_{IO}$ | I/O   |      |      | 7    | pF   |

| High level output voltage  | V <sub>OH</sub>  | I <sub>O</sub> = -5.0 mA  | 2.4                       |      | V    |            |
| Low level output voltage   | V <sub>OL</sub>  | I <sub>O</sub> = +4.2 mA  |                           | 0.4  | V    |            |

Notes 1. I<sub>CC1</sub>, I<sub>CC3</sub>, I<sub>CC4</sub>, I<sub>CC5</sub> and I<sub>CC6</sub> depend on cycle rates (t<sub>RAC</sub> and t<sub>RC</sub>).

2. Specified values are obtained with outputs unloaded.

3.  $t_{CC1}$  and  $t_{CC3}$  are measured assuming that address can be changed once or less during  $\overline{RAS} \leq V_{IL(MAX)}$  and  $\overline{CAS} \geq V_{IH(MIN)}$ .
4.  $t_{CC3}$  is measured assuming that all column address inputs are held at either high or low.
5.  $t_{CC4}$  is measured assuming that all column address inputs are switched only once during each fast page cycle.

|                                  | μPD424400        |                          | -      | 16                       | -      | 16                       | -      | 16                        | -      | ms   |       |

- ★ **Notes** 1. In  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  refresh cycles,  $t_{\text{RAS}}(\text{MAX.})$  is 100 μs. If  $10 \mu\text{s} < t_{\text{RAS}} < 100 \mu\text{s}$ ,  $\overline{\text{RAS}}$  precharge time for  $\overline{\text{CAS}}$  before  $\overline{\text{RAS}}$  self refresh ( $t_{\text{RPS}}$ ) is applied.
- 2. For read cycles, access time is defined as follows:

| Input conditions  | Access time                   | Access time from $\overline{\text{RAS}}$       |
|---|-------------------------------|--|
| $t_{\text{RAD}} \leq t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$ | $t_{\text{RAC}}(\text{MAX.})$ | $t_{\text{RAC}}(\text{MAX.})$                  |
| $t_{\text{RAD}} > t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$    | $t_{\text{AA}}(\text{MAX.})$  | $t_{\text{RAD}} + t_{\text{AA}}(\text{MAX.})$  |
| $t_{\text{RCD}} > t_{\text{RCD}}(\text{MAX.})$  | $t_{\text{CAC}}(\text{MAX.})$ | $t_{\text{RCD}} + t_{\text{CAC}}(\text{MAX.})$ |

$t_{\text{RAD}}(\text{MAX.})$  and  $t_{\text{RCD}}(\text{MAX.})$  are specified as reference points only; they are not restrictive operating parameters. They are used to determine which access time ( $t_{\text{RAC}}$ ,  $t_{\text{AA}}$  or  $t_{\text{CAC}}$ ) is to be used for finding out when output data will be available. Therefore, the input conditions  $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{MAX.})$  and  $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{MAX.})$  will not cause any operation problems.

- 3.  $t_{\text{CRP}}(\text{MIN.})$  requirement is applied to  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$  cycles.
- 4. This specification is applied only to the μPD42S4400-60, 42S4400-70.

**Read Cycle**

- Notes** 1. For read cycles, access time is defined as follows:

| Input conditions  | Access time                   | Access time from $\overline{\text{RAS}}$       |
|---|-------------------------------|--|
| $t_{\text{RAD}} \leq t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$ | $t_{\text{RAC}}(\text{MAX.})$ | $t_{\text{RAC}}(\text{MAX.})$                  |
| $t_{\text{RAD}} > t_{\text{RAD}}(\text{MAX.})$ and $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{MAX.})$    | $t_{\text{AA}}(\text{MAX.})$  | $t_{\text{RAD}} + t_{\text{AA}}(\text{MAX.})$  |
| $t_{\text{RCD}} > t_{\text{RCD}}(\text{MAX.})$  | $t_{\text{CAC}}(\text{MAX.})$ | $t_{\text{RCD}} + t_{\text{CAC}}(\text{MAX.})$ |

$t_{\text{RAD}}(\text{MAX.})$  and  $t_{\text{RCD}}(\text{MAX.})$  are specified as reference points only; they are not restrictive operating parameters. They are used to determine which access time ( $t_{\text{RAC}}$ ,  $t_{\text{AA}}$  or  $t_{\text{CAC}}$ ) is to be used for finding out when output data will be available. Therefore, the input conditions  $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{MAX.})$  and  $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{MAX.})$  will not cause any operation problems.

- 2. Either  $t_{\text{RCH}}(\text{MIN.})$  or  $t_{\text{RRH}}(\text{MIN.})$  should be met in read cycles.
- 3.  $t_{\text{OFF}}(\text{MAX.})$  and  $t_{\text{OEF}}(\text{MAX.})$  define the time when the output achieves the condition of Hi-Z and is not referenced to  $V_{\text{OH}}$  or  $V_{\text{OL}}$ .

- Notes**
1. t<sub>WP(MIN)</sub> is applied to late write cycles or read modify write cycles. In early write cycles, t<sub>WCH(MIN)</sub> should be met.
  2. If t<sub>WCS</sub> ≥ t<sub>WCS(MIN)</sub>, the cycle is an early write cycle and the data out will remain Hi-Z through the entire cycle.
  3. t<sub>DS(MIN)</sub> and t<sub>DH(MIN)</sub> are referenced to the  $\overline{\text{CAS}}$  falling edge in early write cycles. In late write cycles and read modify write cycles, they are referenced to the WE falling edge.

**Read Modify Write Cycle**

| Parameter                                | Symbol           | t <sub>RAC</sub> = 60 ns |      | t <sub>RAC</sub> = 70 ns |      | t <sub>RAC</sub> = 80 ns |      | t <sub>RAC</sub> = 100 ns |      | Unit | Note |

Read Cycle

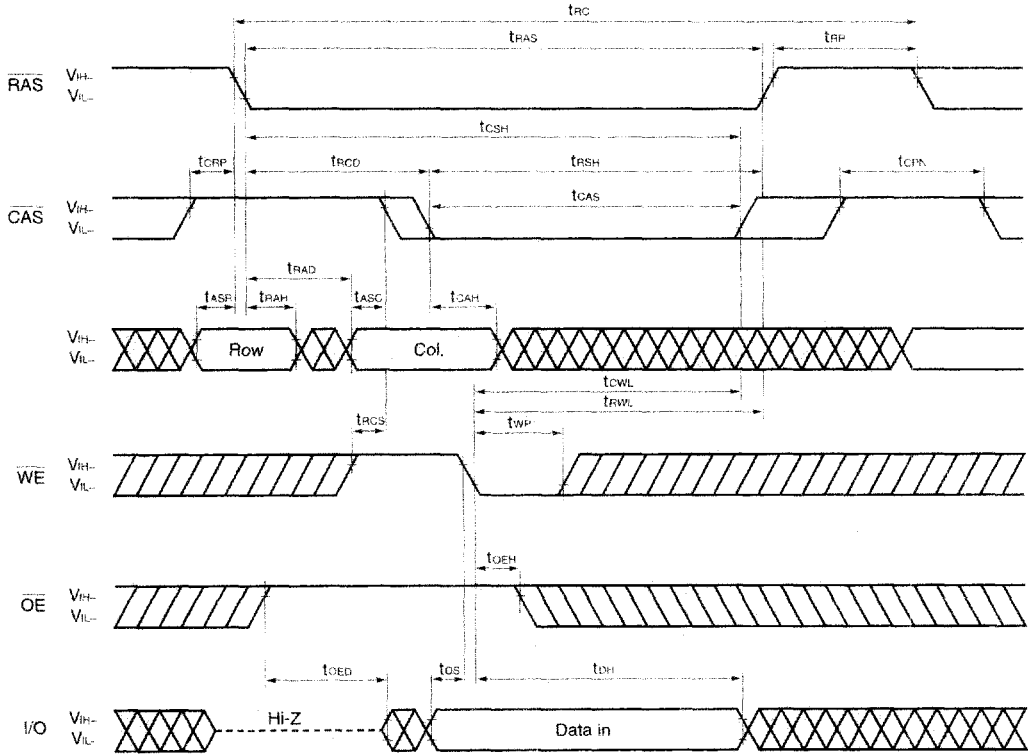

Early Write Cycle

Remak  $\overline{OE}$ : Don't care

Late Write Cycle

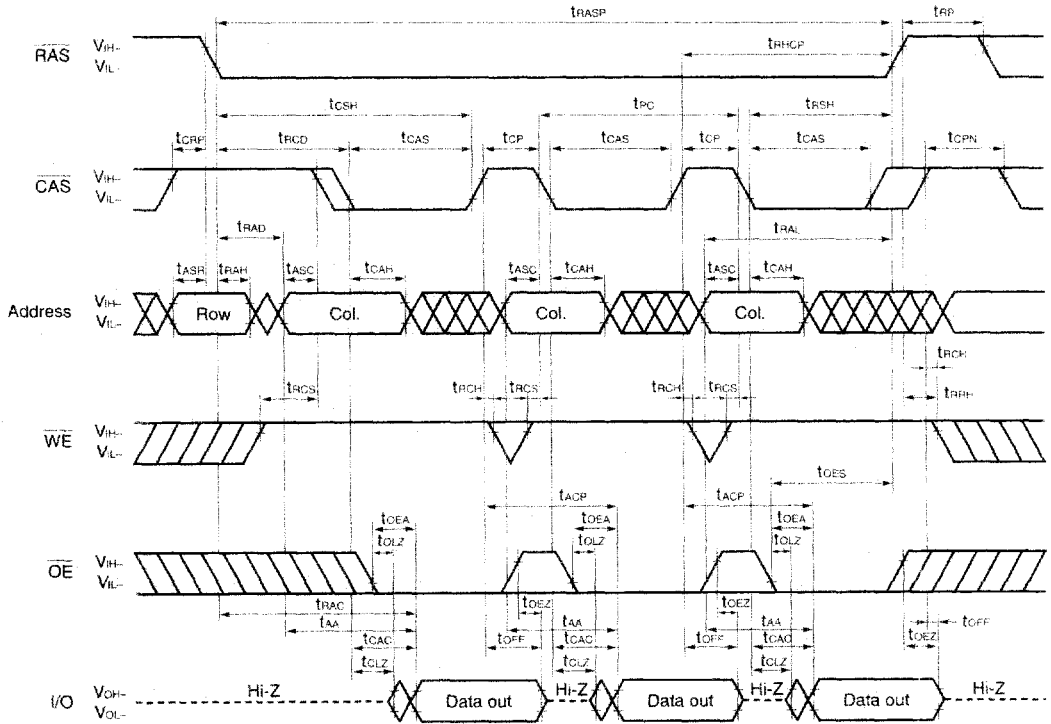

Read Modify Write Cycle

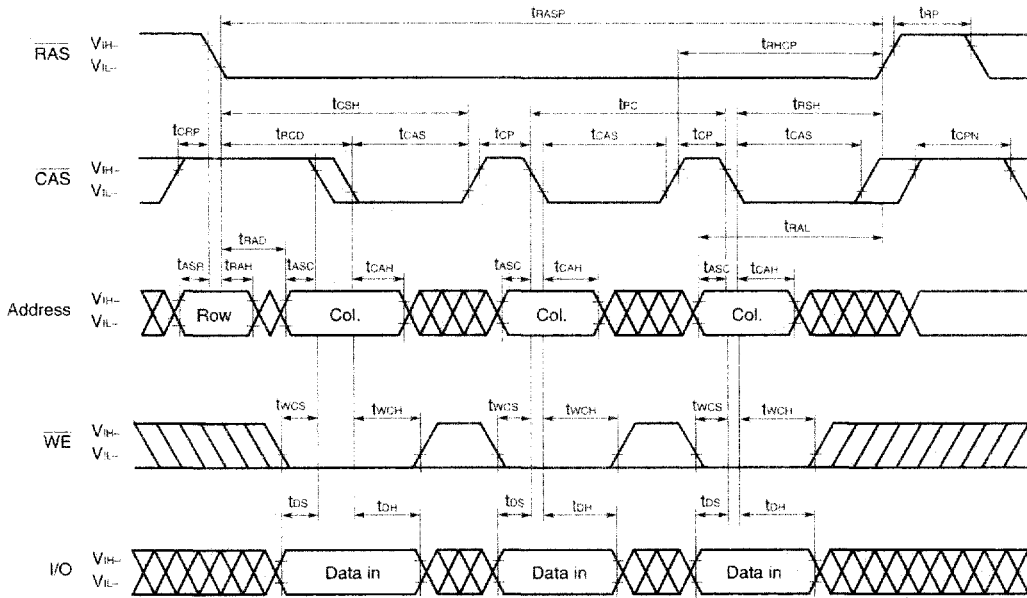

Fast Page Mode Read Cycle

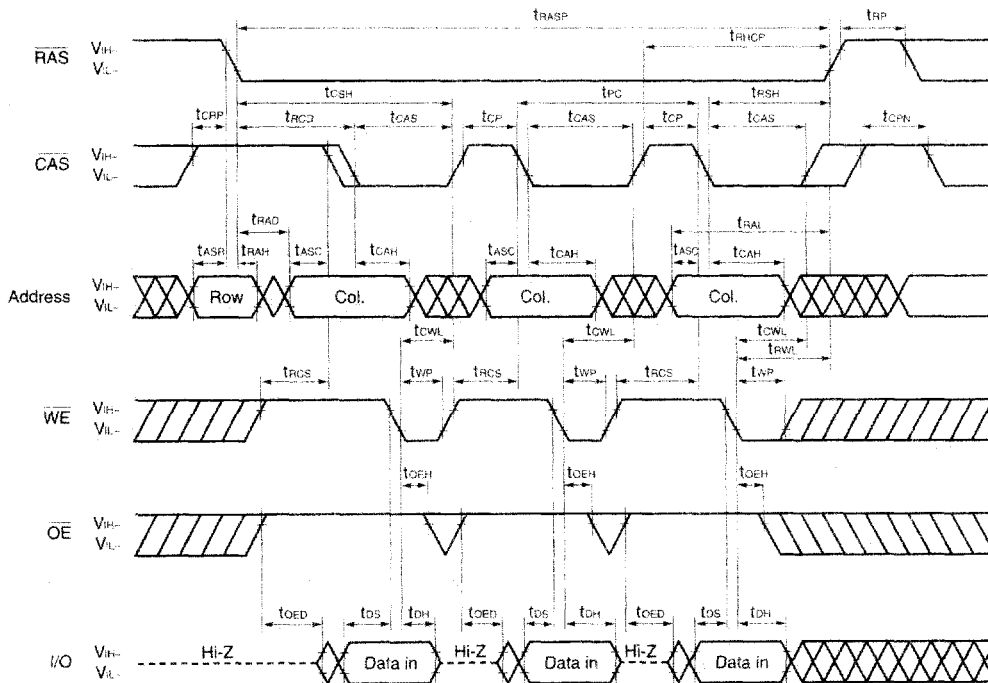

**Remark** In the fast page mode, read, write and read modify write cycles are available for each of the consecutive  $\overline{\text{CAS}}$  cycles within the same RAS cycle.

Fast Page Mode Early Write Cycle

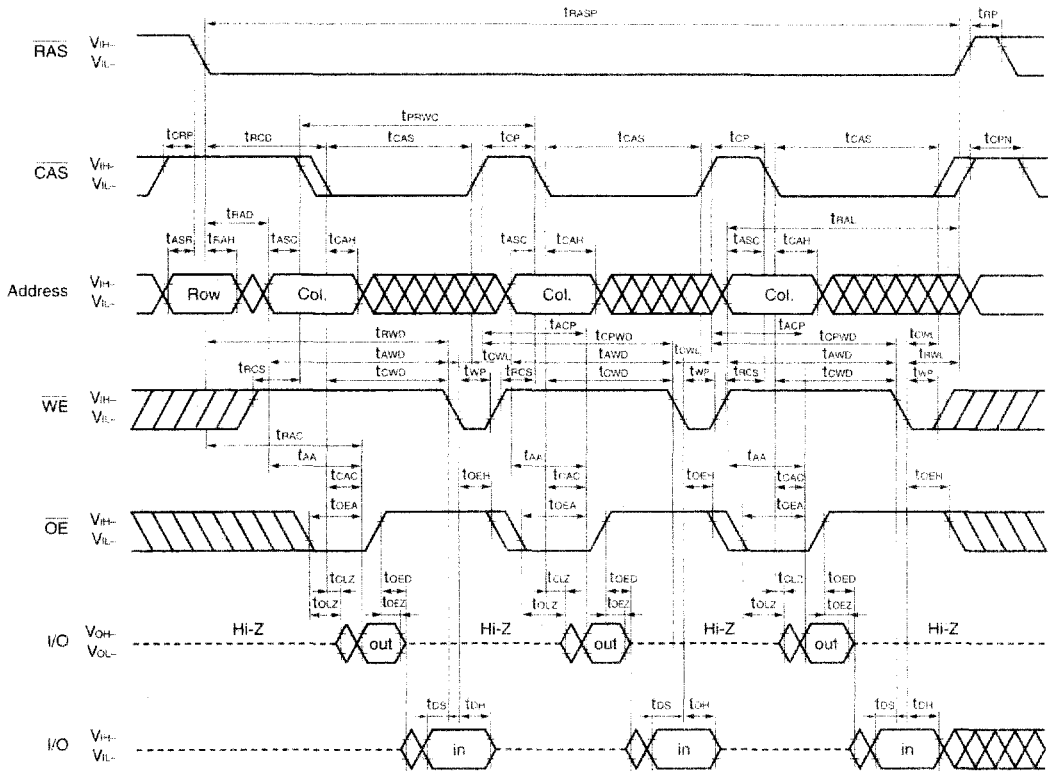

- Remarks**
1.  $\overline{OE}$ : Don't care
  2. In the fast page mode, read, write and read modify write cycles are available for each of the consecutive CAS cycles within the same RAS cycle.

Fast Page Mode Late Write Cycle

**Remark** In the fast page mode, read, write and read modify write cycles are available for each of the consecutive CAS cycles within the same RAS cycle.

**Fast Page Mode Read Modify Write Cycle**

**Remark** In the fast page mode, read, write and read modify write cycles are available for each of the consecutive CAS cycles within the same RAS cycle.

**CAS Before RAS Self Refresh Cycle (Only for the μPD42S4400)**

**Remark** Address,  $\overline{OE}$ : Don't care I/O: Hi-Z

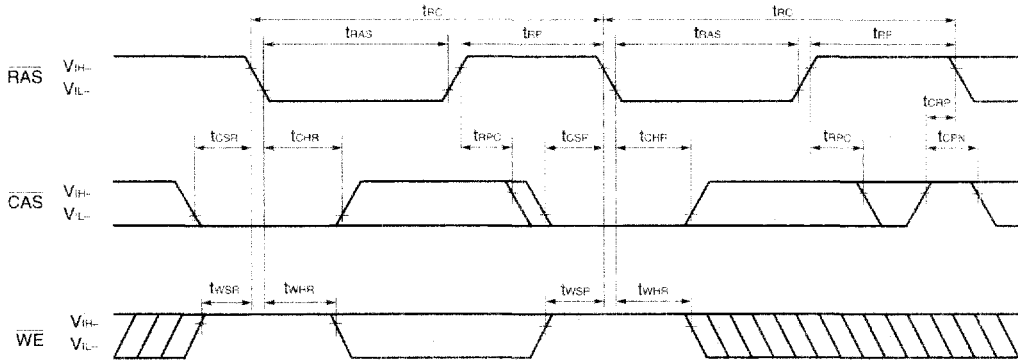

**Cautions on Use of CAS Before RAS Self Refresh**

CAS before RAS self refresh can be used independently when used in combination with distributed CAS before RAS long refresh; However, when used in combination with burst CAS before RAS long refresh or with long RAS only refresh (both distributed and burst), the following cautions must be observed.

- (1) **Normal Combined Use of CAS Before RAS Self Refresh and Burst CAS Before RAS Long Refresh**  
When CAS before RAS self refresh and burst CAS before RAS long refresh are used in combination, please perform CAS before RAS refresh 1,024 times within a 16 ms interval just before and after setting CAS before RAS self refresh.
- (2) **Normal Combined Use of CAS Before RAS Self Refresh and Long RAS Only Refresh**  
When CAS before RAS self refresh and RAS only refresh are used in combination, please perform RAS only refresh 1,024 times within a 16 ms interval just before and after setting CAS before RAS self refresh.
- (3) **If  $t_{RAS(MIN)}$  is not satisfied at the beginning of CAS before RAS self refresh cycles ( $t_{RAS} < 100 \mu s$ ), CAS before RAS refresh cycles will be executed one time. ★**  
If  $10 \mu s < t_{RAS} < 100 \mu s$ , RAS precharge time for CAS before RAS self refresh ( $t_{RPS}$ ) is applied. And refresh cycles (1,024/128 ms) should be met.

For details, please refer to **How to use DRAM User's Manual**.

★ **CAS Before RAS Refresh Cycle**

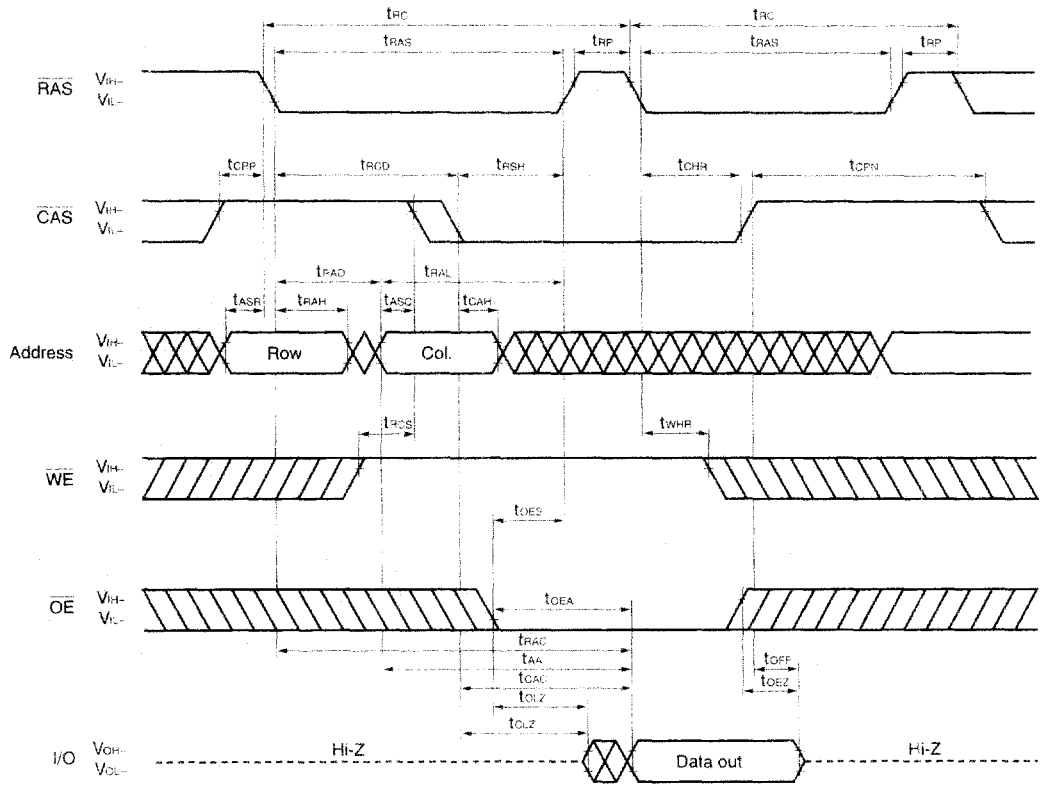

**Remark** Address,  $\overline{\text{OE}}$ : Don't care I/O: Hi-Z

**RAS Only Refresh Cycle**

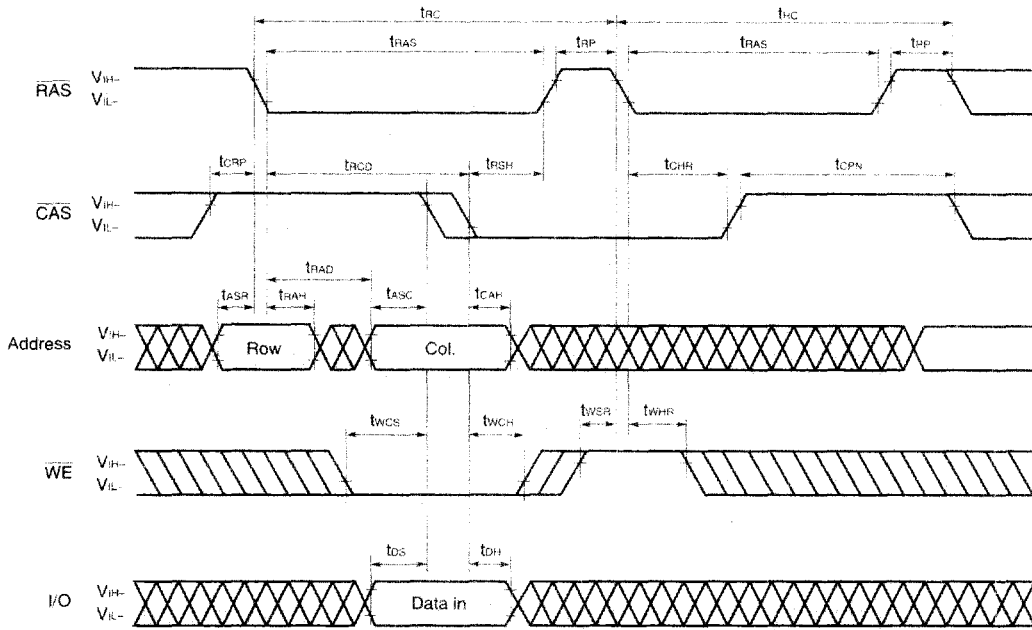

**Remark**  $\overline{\text{WE}}$ ,  $\overline{\text{OE}}$ : Don't care I/O: Hi-Z

Hidden Refresh Cycle (Read)

★ Hidden Refresh Cycle (Write)

Remark  $\overline{OE}$ : Don't care

**Test Mode Set Cycle ( $\overline{WE}$ ,  $\overline{CAS}$  Before  $\overline{RAS}$  Refresh Cycle)**

**Remark** Address,  $\overline{OE}$ : Don't care I/O: Hi-Z

**Test Mode**

By using the test mode, the test time can be reduced. The reason for this is that, the memory emulates the  $\times 8$ -bit organization during test mode. Don't care about the input level of the  $\overline{CAS}$  input A0.

**(1) Setting the mode**

Executing the test mode cycle ( $\overline{WE}$ ,  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle) sets the test mode.

**(2) Write/read operation**

When either a "0" or a "1" is written to the input pin in test mode, this data is written to 8 bits of memory cell.

Next, when the data is read from the output pin at the same address, the cell can be checked.

Output = "1": Normal write (all memory cells)

Output = "0": Abnormal write

**(3) Refresh**

Refresh in the test mode must be performed with the  $\overline{RAS}$  /  $\overline{CAS}$  cycle or with the  $\overline{WE}$ ,  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle. The  $\overline{WE}$ ,  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle use the same counter as the  $\overline{CAS}$  before  $\overline{RAS}$  refresh's internal counter.

**(4) Mode Cancellation**

The test mode is cancelled by executing one cycle of  $\overline{RAS}$  only refresh cycle or  $\overline{CAS}$  before  $\overline{RAS}$  refresh cycle.

26 PIN PLASTIC SOJ (300 mil)

NOTE  
 Each lead centerline is located within 0.12 mm (0.005 inch) of its true position (T.P.) at maximum material condition.

| ITEM | MILLIMETERS                            | INCHES                                    |

P261 A-50A-2

**Recommended Soldering Conditions**

The following conditions (see tables below and next page) must be met for soldering conditions of the μPD42S4400, 424400.

For more details, refer to our document "SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL" (IEI-1207).

Please consult with our sales offices in case other soldering process is used, or in case the soldering is done under different conditions.

**Types of Surface Mount Device**

μPD42S4400GS-9JD, 424400GS-9JD: 26-pin plastic TSOP (II) (300 mil)

| Soldering process      | Soldering conditions   | Symbol     |
|------------------------|--|------------|
| Infrared ray reflow    | Peak temperature of package surface: 235 °C or lower,<br>Reflow time: 30 seconds or less (210 °C or higher),<br>Number of reflow processes: MAX. 2<br>Exposure limit: 7 days <sup>Note</sup><br>(10 hours pre-baking is required at 125 °C afterwards)<br><br><b>Cautions</b><br>1. <b>After the first reflow process, cool the package down to room temperature, then start the second reflow process.</b><br>2. <b>After the first reflow process, do not use water to remove residual flux (water can be used in the second process).</b> | IR35-107-2 |
| VPS                    | Peak temperature of package: 215 °C or lower,<br>Reflow time: 40 seconds or less (200 °C or higher),<br>Number of reflow processes: MAX. 2<br>Exposure limit: 7 days <sup>Note</sup><br>(10 hours pre-baking is required at 125 °C afterwards)<br><br><b>Cautions</b><br>1. <b>After the first reflow process, cool the package down to room temperature, then start the second reflow process.</b><br>2. <b>After the first reflow process, do not use water to remove residual flux (water can be used in the second process).</b>         | VP15-107-2 |
| Partial heating method | Terminal temperature: 300 °C or lower,<br>Time: 3 seconds or lower (Per side of the package).  |            |

**Note** Exposure limit before soldering after dry-pack package is opened.  
 Storage conditions: 25 °C and relative humidity at 65 % or less.

**Caution** Do not apply more than one soldering method at any one time, except for "Partial heating method".

μPD42S4400LA, 424400LA: 26-pin plastic SOJ (300 mil)

| Soldering process      | Soldering conditions   | Symbol     |
|------------------------|--|------------|
| Infrared ray reflow    | Peak temperature of package surface: 235 °C or lower,<br>Reflow time: 30 seconds or less (210 °C or higher),<br>Number of reflow processes: MAX. 2<br>Exposure limit: 7 days <b>Note</b><br>(20 hours pre-baking is required at 125 °C afterwards)<br><b>Cautions</b><br>1. After the first reflow process, cool the package down to room temperature, then start the second reflow process.<br>2. After the first reflow process, do not use water to remove residual flux (water can be used in the second process). | IR35-207-2 |
| VPS                    | Peak temperature of package: 215 °C or lower,<br>Reflow time: 40 seconds or less (200 °C or higher),<br>Number of reflow processes: MAX. 2<br>Exposure limit: 7 days <b>Note</b><br>(20 hours pre-baking is required at 125 °C afterwards)<br><b>Cautions</b><br>1. After the first reflow process, cool the package down to room temperature, then start the second reflow process.<br>2. After the first reflow process, do not use water to remove residual flux (water can be used in the second process).         | VP15-207-2 |
| Partial heating method | Terminal temperature: 300 °C or lower,<br>Time: 3 seconds or less (Per side of the package).   | _____      |

**Note** Exposure limit before soldering after dry-pack package is opened.  
 Storage conditions: 25 °C and relative humidity at 65 % or less.

**Caution** Do not apply more than one soldering method at any one time, except for "Partial heating method".
